DETAILED ACTION

Specification

1. The application has not been checked to the extent necessary to determine the presence of all possible typographical and grammatical errors. However, Applicant's cooperation is requested in correcting any errors of which he/she may become aware in the application.
2. Sub-headings of the specification are missing (i.e.: background of the invention, summary of the invention, brief description of the drawings, and detailed description of the drawings). Correction is required (see chapter 600 of MPEP, section 601).

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 8-9, and 13-15 are rejected under 35 U.S.C. 102(b) as being anticipated by Kearney et al. (US 5,631,602) (hereinafter referred to as '**Kearney**').

Regarding claim 8, Kearney discloses the arrangement of claim 8, including an analog amplifier (38) having an input port (40,42) for receiving a first signal and a test input port (52) for receiving test signal (VT), a control input port (54, 56), and an output port (44), the analog amplifier responsive to a first and a second condition (normal operation mode or test mode) present at the control input port, such that when the first

Art Unit: 2819

condition is present (when VT is set to a logic low or switches SA and SB are open) at the control port, the output port is operatively connected to the input port and when the second condition is present (when VT is changed to a logic high) at the control input port, the output port (54) is operably connected to the test input port (see Fig. 6 and column 4, lines 35-45).

Regarding claim 9, Kearney discloses the first condition present at the control input port is a first control signal (the signal that sets VT to the logic low); and the second condition present at the control input port is a second control signal (when SA/SB are turned on).

Regarding claim 13, Kearney discloses the analog amplifier (38) is a fully differential amplifier (column 4, line 47).

Regarding claims 14-15, Kearney discloses the test input port for receiving a test signal, which is provided from a test signal source or generator (Figs. 5-6).

Allowable Subject Matter

4. Claims 10-12 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claims 16-19 are allowed.

Prior Art

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure (see the attached PTO-892).
